

FOREWORD

Bid and tender work is ready for agentic AI.

The question is how to install it well.

For most of my career I have worked inside bid and tender processes, first as an engineer feeding technical content, later as the Bid Director accountable for the outcome. The process was always well defined: qualify, set the strategy, analyse requirements, write or specify, review, evaluate, approve. What changed from one pursuit to the next was never the process. It was the people available to run it.

Strong teams carried weak processes. Stretched teams let good ones slip. When an experienced manager moved on, much of the commercial memory went with them, and the next pursuit started from a blank page.

I have also seen organisations try to fix this with more people, more templates or another software licence. Each helps for a while. None of them changes the underlying problem: the way the work is done still lives in individuals rather than in the organisation.

That combination, a well-defined process delivered through variable capacity, is exactly where agentic AI now earns its place. In 2026, agents can reliably read, structure, draft, compare, check and coordinate, provided they work inside clear rules and answer to people.

This is not about replacing your team or adding another tool. It is about installing a system that carries the baseline: coordination, production, evidence, consistency and memory. Your people spend their time on relationships, strategy, negotiation and the decisions only they should make.

IN THIS BROCHURE

01	Foreword	1

04	How your team uses it	4
05	Three steps to get started	5

Give the repeatable work to a system. Keep the judgement with your people.

Think of it as a very capable team member who never forgets, never leaves and always follows the agreed process, but never signs anything off. Every material decision still belongs to a named person.

Done well, the system is largely invisible. It works inside your existing folders and documents, and the team feels better supported rather than managed by software.

Doing it well is the hard part. It takes someone who knows bid and tender management from the inside, and a method for tailoring the system to your gates, your decision rights and your knowledge. Most of the effort goes into the organisation, not the technology. That is what Ignis does.

Yorik Tisseau · Ignis

IN SHORT

What does Ignis do?

Ignis has developed a proprietary governed agentic system for bid and tender teams, and installs it specifically for each organisation.

Where do you start?

With an audit of how your desk works today. Then one capability on live work, scaled as it proves its value.

THE AGENTIC AI SYSTEM

Sophisticated underneath.

Simple for the team.

People continue to see familiar bid and tender work. Behind it sits one governed engine with two modes: bid mode for organisations responding to tenders, and tender mode for organisations issuing them and evaluating the responses. Both share the same governance and memory.

01

Execution

Coordinates specialist agents through agreed protocols, reusable skills and authorised tools.

02

Governance and controls

Defines what agents may do, which sources they may use and where human approval is required.

03

Knowledge and memory

Starts every task from approved organisational knowledge and the current truth of the pursuit.

A proprietary system that governs the agents.

MODULAR BY DESIGN

Every agent, protocol and skill is a module, mapped across the bid and tender lifecycle. It is not about the amount: you start with what makes sense for your desk and add more as value is proven.

Fixed workflows where the process must be exact. AI only where judgement adds value.

WHAT IT TAKES TO BUILD

A bespoke system.

Built on a proven foundation. Calibrated for you.

An agentic system is **not a single prompt**. It is **the back end: tens, often hundreds, of files** that define roles, skills, protocols, rules and context. Getting them right, **for your organisation**, is what makes it useful.

HOW IGNIS BUILDS IT

01 Designed from bid and tender practice

The agentic work is written by someone who has run bids and tenders from the inside, so roles, protocols and gates reflect how the work really happens.

02 Calibrated to your governance and context

The library is calibrated to your governance, meaning your stages, gates, decision rights and approval rules, and to your enterprise context: templates, documentation, standard positions and evidence.

03 Improved where it matters

We look at what works well and should be kept, and where process, documentation or tools fall short. We improve those first, so the system builds on solid ground rather than automating existing gaps.

04 Embedded on the desk

We install, test and fine-tune on live or recent work until the system blends into daily routines, with ownership, controls and human gates in place.

WHAT THE SYSTEM IS MADE OF

Orchestrator

Plans, routes and tracks the work, and brings decisions back to the team.

Specialist agents

Six bounded roles, each owning a defined part of the pursuit.

Protocols

Bespoke activities that run through the bid and tender management lifecycle, step by step.

Skills

Reusable tasks an agent can perform.

Tools

Authorised connections to your documents and systems.

Rules and human gates

What agents may do, and which decisions need named approval.

Enterprise context

Your approved knowledge, positions and evidence, so every output reflects how your organisation works, not generic AI.

Bid state and bid log

The live truth of the pursuit and the record of how it got there.

Learning

Lessons that improve the next pursuit.

READY TO DEPLOY

The groundwork is done.

What remains is a focused calibration to make it yours. The foundation is built and tested: a library of agents, protocols and skills designed specifically for governed bid and tender work.

Not everything is installed at once. We start with what makes sense for your desk.

It runs inside your own cloud and enterprise AI model, respects the permissions you already have, and nothing leaves your organisation.

Every capability is configured around the client's own work, evidence, permissions, decision rights and tools.

HOW YOUR TEAM USES IT

One system for the whole team.

Blended into how you already work.

Everyone works from the same central system, the same knowledge and the same live picture of the pursuit. Results no longer depend on who writes the best prompts or who knows where the information sits.

Your team keeps working the way it does today. In the background, the system always knows where the pursuit stands and what needs to happen next. This is what that looks like in practice.

When the documents arrive

A new opportunity lands in the central folder. The system reads the pack, extracts the requirements into your own compliance format, keeps the tables as they are and opens the live record of the pursuit. The team opens a familiar document, not a new tool.

At the first gate

Before anyone commits time, the system prepares the qualification pack against your criteria: what supports going ahead, what needs judgement and what is still unknown. The decision sits with the named people who own it.

The agents prepare. People decide.

While the work is under way

People keep working in their usual documents. The agents draft from approved evidence, check consistency and flag gaps. When a clarification changes an assumption, the system shows which responses, prices and risks it touches.

Whenever someone needs to know

Anyone can ask where things stand, what changed since yesterday or what needs attention before tomorrow. The answer comes from the live record, not from whoever happens to remember.

SEAMLESS TAKES WORK

Your operation changes.
The day-to-day
experience does not
have to.

You acquire a proprietary agentic system, developed by Ignis and installed specifically for your organisation. Getting it to feel natural takes careful design, testing on real work and fine-tuning with the team.

The result: the capability of a transformed operation, delivered through the documents, gates and routines your people already know.

WHAT THE TEAM GAINS

Stronger position

Better-evidenced submissions and better-informed decisions, pursuit after pursuit.

More capacity

Progress more of the right opportunities without turning every package into a fire drill.

Stronger control

Evidence and open issues reach the right people sooner, with human approval on every material commitment.

Continuity that stays

Retain context, decisions and learning rather than starting again on every pursuit.

THREE STEPS TO GET STARTED

Start with what makes sense.

Grow as your organisation learns.

Every organisation runs its bids and tenders differently, and its knowledge sits in different places. So we never start by installing software. We start by understanding your desk, then shape the system around it in three steps. Each step is fixed in scope and agreed before it starts, and you decide at every stage whether to continue.

01

Audit

A short, fixed-scope review of how work, information and decisions really move on your desk: what works well and should be kept, and where capacity, continuity or control breaks. You come away with a clear picture and a recommendation on where to start.

02

Design

Governance mapping and context engineering

We map your governance, meaning your stages, gates, decision rights, templates and approval rules, into the protocols the system runs, including the points where named people must decide. In parallel we engineer your enterprise context: approved knowledge, past bids and tenders, standard positions and evidence, with weak documentation improved first.

03

Pilot on live work

We install one capability on live or recent work: one mode, bid or tender, calibrated with your team and measured against what matters to you. You see the value on real work before committing further.

Scale what works.

If the pilot proves useful, we extend it step by step, adding capabilities and then the second mode, which is faster because the groundwork is already done. Ongoing support keeps the system calibrated as your practice, people and tools evolve.

GET IN TOUCH

Where is your bid and tender practice today?

A short conversation to understand how mature your process is, where capacity or control is breaking, and what it would take to move to a governed agentic system.
