01 / WHAT YOU TOLD US

YOUR PERSPECTIVE
Business leader

PROJECT VIEW
Across the full project lifecycle

12-MONTH PRIORITY
Handle more work with the team we have

NAMED BOTTLENECK
Finding and trusting data or evidence

02 Our working interpretation

50/100 / Shared practice

AI use

From your view of the business, AI use is spreading across a team or wider business. You are moving beyond isolated prompting, but the answers suggest there is still work to do before it becomes a dependable system.

Likely constraint

Data and evidence is the lowest measured foundation at 39/100. Data and evidence looks like the clearest barrier to scaling AI reliably. Strengthening it will make shared use easier to trust and repeat.

03 Answer signals behind that reading

CONSTRAINT SIGNAL
Data and evidence / D1 / Somewhat disagree

We can quickly find the latest approved information needed for live work.

CONSTRAINT SIGNAL
Data and evidence / D2 / Somewhat disagree

We can trace important figures and claims back to their source.

COUNTER-SIGNAL
AI today / A4 / Somewhat agree

People here use AI for repeatable work, not only one-off prompts.

04 / CONFIDENCE AND LIMITS

34 of 34 scored statements were within this respondent’s view. This is one person’s self-report, not a verified audit or a comparison with other developers.

The decision / a first test

Prepared for Alex

05 Two routes to examine

FIRST CANDIDATE

Build a governed evidence base

AI cannot reliably reuse information that is hard to find, out of date or disconnected from its source.

Choose the evidence used most often in one workflow; assign owners, approved versions and source checks.

Both areas scored 39/100. Your named bottleneck breaks the tie; do not assume either is causal.

ALTERNATIVE TO CHECK

Also test: delivering work

This area scored 39/100. Test obligation and handover checks in one live project. It may be a parallel need, not the first dependency.

If the first build removes no real friction, compare this route against the same baseline before expanding either one.

06 A bounded validation plan

01 BASELINE	Choose one live project and a handover. Record current time, rework, errors and decision ownership.
02 TEST	Test retrieval and checking on one live submission, procurement or project question. Test this priority across one live project's stages and handovers before applying it across the pipeline.
03 DECIDE	Ask commercial data owner with the relevant workstream lead to review output quality, evidence, human sign-off and whether the pilot improved the baseline.

07 Questions before committing

Which handover between project stages would have changed? Can the team show the approved source, correction path and human sign-off? What would make this worth repeating on the next project?

WATCH-OUT These answers do not prove a stage-level gap, financial cost or causal saving.
